

SonDaSys Testplan

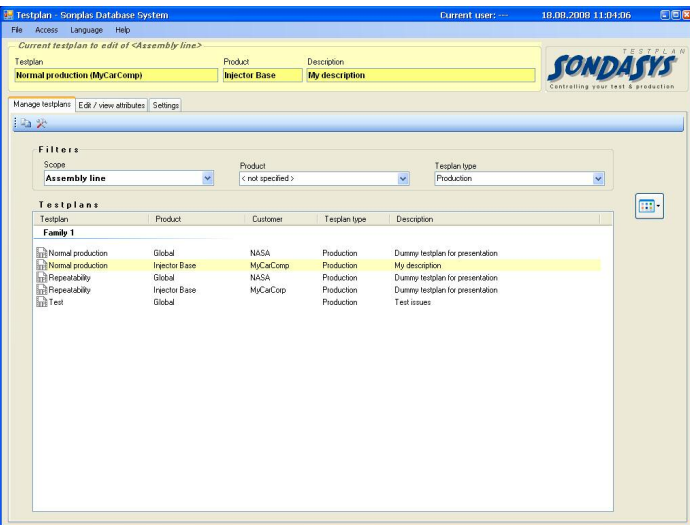

Edit Testplan Attributes

Highlights

- Testplan Revision Handling: All testplan contain the property revision. This guarantees full traceability for the used production settings. It is possible to restore all the parameters of a part that were used during production.
- No limits on the amount of testplan. Testplans may be copied.
- Range check on user point. If a setpoint value may be a risk for the machine or the part, Limits may be passed to the attribute, so that the user must not dangerous values.
- Full localized language support. All windows, messages and used names can be translated in all languages with roman characters.
- Software is written in newest .NET technology using 100 % managed code.
- Data is stored in one of the world leading databases: ORACLE.

Choose Testplan

Brief description

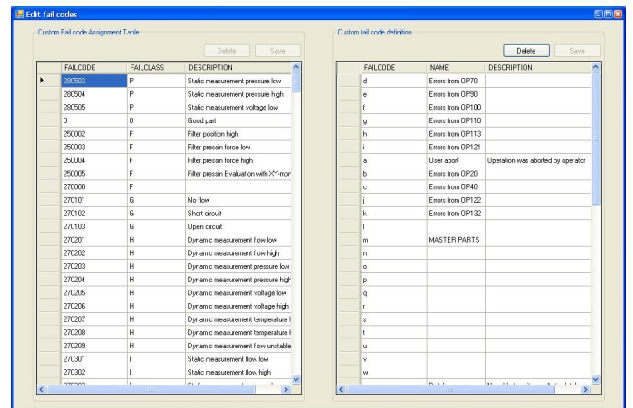

SonDaSys Testplan is a database tool to edit process control settings. Testplans contain all relevant set points and ranges, used in production and test conditions.

SonDaSys Testplan controls:

- Set points to be set to machines hard- or software
- Ranges necessary in the process control (e. g. range check of the pressure as start condition for flow measurement)
- Ranges for part's quality check (good / scrap ranges)
- Correction value database, correction values to be used to align different station's results, or to adjust the measurements to reference benches.
